1. Product introduction

SimpleFOC MINI is an Arduino-compatible open source FOC project. After years of contributions from developers, it has become very mature in low-power BLDC applications. MKS MINI FOC is fully compatible with the Arduino interface, and supports a variety of sensor interfaces; users can easily use the SimpleFOCLibrary library to control BLDC motors, to achieve smooth motor operation, high-precision positioning, etc. The encoder supports common IIC and ABI, PWM, HALL, SPI formats. By sampling the voltage of the sampling resistor connected in series with the motor, the online current of A and B phases is obtained to realize the current loop control, and a truly complete FOC algorithm is constructed.

1.1 Hardware features

Size	54.6mm*68.3mm
Input voltage range	12-24V
Number of supported motors	2
Peak current	5A(2.5A per channel)

Driver chip	DRV8313
Master	ESP32 WROOM 32D
Encoders supported	IIC、ABI、SPI、HALL
Current Sense Resistor	10mR

1.2 Size

2. User's guidance

This section will briefly introduce MKS MINI FOC V1.0, and explain the relevant preparations before using MKS MINI FOC V1.0.

2.1 Necessary hardware

- PC with Windows
- MKS MINI FOC V1.0
- USB-B data line
- 12V-24V DC Power supply
- One or two gimbal motors
- One or two encoders (magnetic encoder, Hall encoder, etc.) Magnetic encoders are recommended

2.2 Hardware preparation

MKS MINIFOC has been fully tested before delivery. In order to ensure the quality of use, it is recommended that users check it before powering on for the first time.

Check content includes

1. Use a multimeter to check whether there is a short circuit between the positive and negative terminals of VIN on the driver board, as shown in Figure 1
2. Use a multimeter to check whether the 5V of the driver board is shorted to GND, as shown in Figure 2
3. Use a multimeter to check whether the 3.3V of the driver board is shorted to GND, as shown in Figure 3

Figure 1 Measuring whether Vin is short-circuited

Figure 2 Measuring whether 5V is shorted-circuited

Figure 3 Measuring whether is short-circuited

After the above inspection is completed, connect the 12V-24V power supply to the VIN positive pole and negative pole of the motor driver board

Attention! Do not reverse the positive and negative poles of the power supply!

At this time, the green light of the power indicator light at the lower right corner of the driver board is on, indicating that the startup is normal

2.3 Interface

Encoder Interface Description

For the connection of other encoders, please refer to the notes of the routine and the wiring reference below

IIC interface (based on AS5600 as an example)

AS5600	MKS MINI FOC V1.0	ESP32 WROOM 32D
SCL	SCL_0 (SCL_1)	I019 (I023)
SDA	SDA_0 (SDA_1)	I018 (I05)
3.3V	3.3V	/
GND	GND	/
DIR	GND/3.3V/Dangling	/

Note: Any exchange of two phases of the motor can change the direction of rotation

SPI Interface

SPI Interface	MKS MINI FOC V1.0	ESP32 WROOM 32D
MISO	SDA_0	I019
MOSI	SDA_1	I023
SCLK	SCL_0	I018
SS	SCL_1	I05

Note: Interfaces I_0 (I015) and I_1 (I013) of MKS MINI FOC V1.0 can be used as chip select signals

ABI Interface

ABI Interface	MKS MINI FOC V1.0	ESP32 WROOM 32D
A0	SDA_0	I019
B0	SCL_0	I018
I0	I_0	I015
A1	SDA_1	I023
B1	SCL_1	I05
I1	I_1	I013

Hall encoder interface

Hall encoder interface	MKS MINI FOC V1.0	ESP32 WROOM 32D
HALLO_1	SDA_0	I019
HALLO_2	SCL_0	I018
HALLO_3	I_0	I015
HALL1_1	SDA_1	I023
HALL1_2	SCL_1	I05
HALL1_3	I_1	I013

If it is open loop, just skip this steps .

2.4 Programming environment configuration

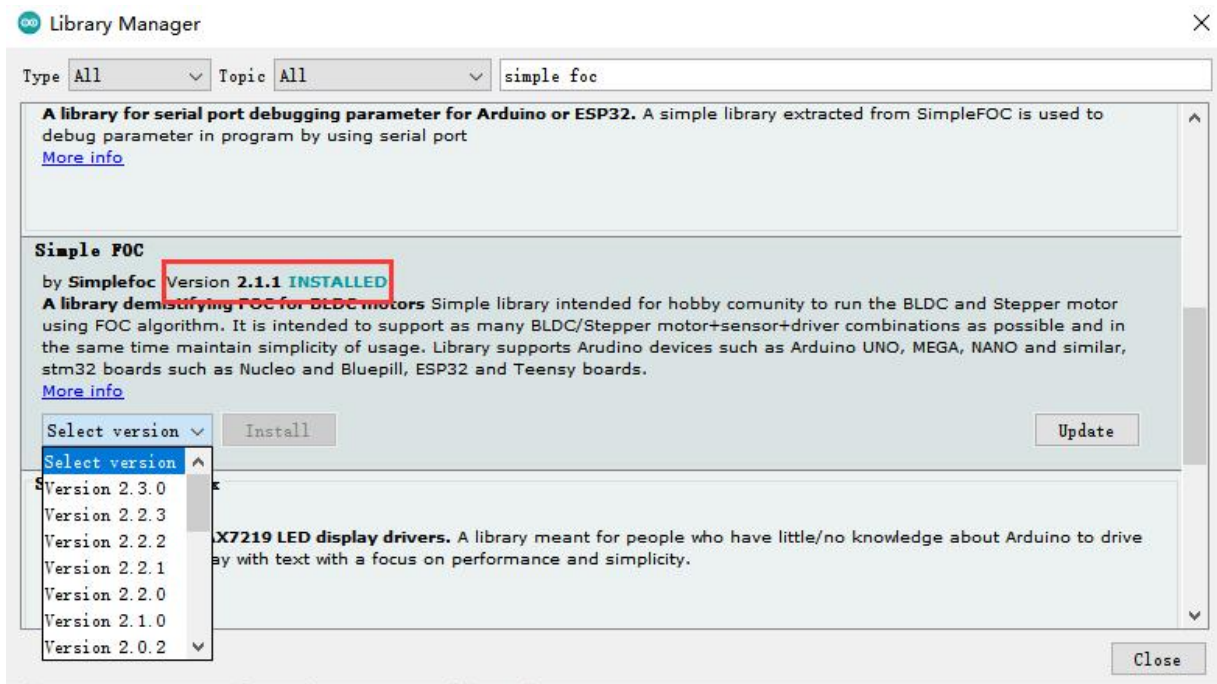

Note: The library version used in this example is 2.1.1. If you have downloaded other versions, please click Tools => Manage Library

Search Simple FOC in the search box

After selecting version 2.1.1, click Install

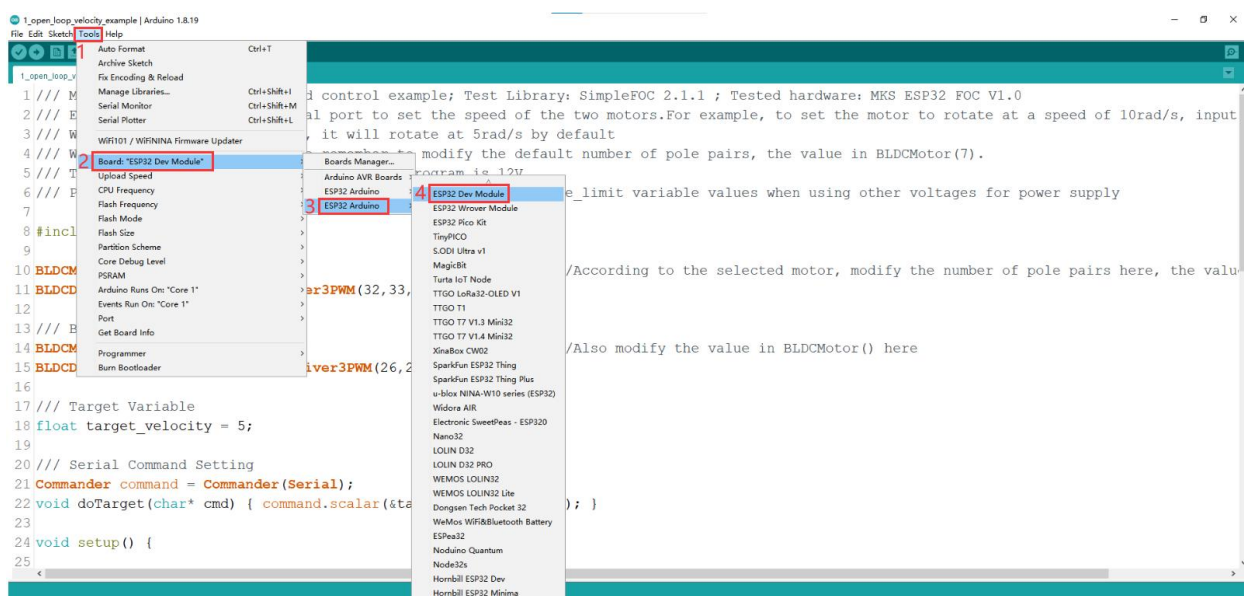

Then restart the Arduino.

2.5 Routine modification

Here, take routine 1 dual-motor open-loop speed test as an example

1. Check the hardware connection, then power on the motherboard.
2. Open the example code with Arduino :
1_open_loop_velocity_example
3. Click tool=Board=ESP32 Arduino=ESP32 Dev Module.

4. Users can choose other motors to test this routine.

If so, some parameters in the code need to be modified

① In line 10 and 14, modify the value of the default number of pole pairs according to the number of pole pairs of the selected motor, that is, the value in the brackets of "BLDCMotor(7)".

```
1 /// MKS ESP32 FOC Open loop speed control example; Test Library: SimpleFOC 2.1.1 ; Tested hardware: MKS ESP32 FOC V1.0
2 /// Enter "T+number" in the serial port to set the speed of the two motors. For example, to set the motor to rotate at a speed of 10rad/s, input
3 /// When the motor is powered on, it will rotate at 5rad/s by default
4 /// When using your own motor, do remember to modify the default number of pole pairs, the value in BLDCMotor(7).
5 /// The default power supply voltage of the program is 12V.
6 /// Please remember to modify the voltage_power_supply , voltage_limit variable values when using other voltages for power supply
7
8 #include <SimpleFOC.h>
9
10 BLDCMotor motor = BLDCMotor(7); //According to the selected motor, modify the number of pole pairs here, the value
11 BLDCDriver3PWM driver = BLDCDriver3PWM(32,33,25,22);
12
13 /// BLDC motor & driver instance
14 BLDCMotor motor1 = BLDCMotor(7); //Also modify the value in BLDCMotor() here
15 BLDCDriver3PWM driver1 = BLDCDriver3PWM(26,27,14,21);
16
17 /// Target Variable
18 float target_velocity = 5;
19
20 /// Serial Command Setting
21 Commander command = Commander(Serial);
22 void doTarget(char* cmd) { command.scalar(&target_velocity, cmd); }
23
24 void setup() {
25
```

② Lines 27-37, modify the values of voltage_power_supply and voltage_limit according to the power supply voltage of the selected motor.

```
19
20 /// Serial Command Setting
21 Commander command = Commander(Serial);
22 void doTarget(char* cmd) { command.scalar(&target_velocity, cmd); }
23
24 void setup() {
25
26
27 driver.voltage_power_supply = 12; //According to the supply voltage, modify the value of voltage_power_supply here
28 driver.init();
29 motor.linkDriver(&driver);
30 motor.voltage_limit = 3; // [V] //According to the supply voltage, modify the value of voltage_limit here
31 motor.velocity_limit = 40; // [rad/s]
32
33 driver1.voltage_power_supply = 12; //Also modify the value of voltage_power_supply here
34 driver1.init();
35 motor1.linkDriver(&driver1);
36 motor1.voltage_limit = 3; // [V] //Also modify the value of voltage_limit here
37 motor1.velocity_limit = 40; // [rad/s]
38
39
40 // Open Loop Control Mode Setting
41 motor.controller = MotionControlType::velocity_openloop;
42 motor1.controller = MotionControlType::velocity_openloop;
43
```

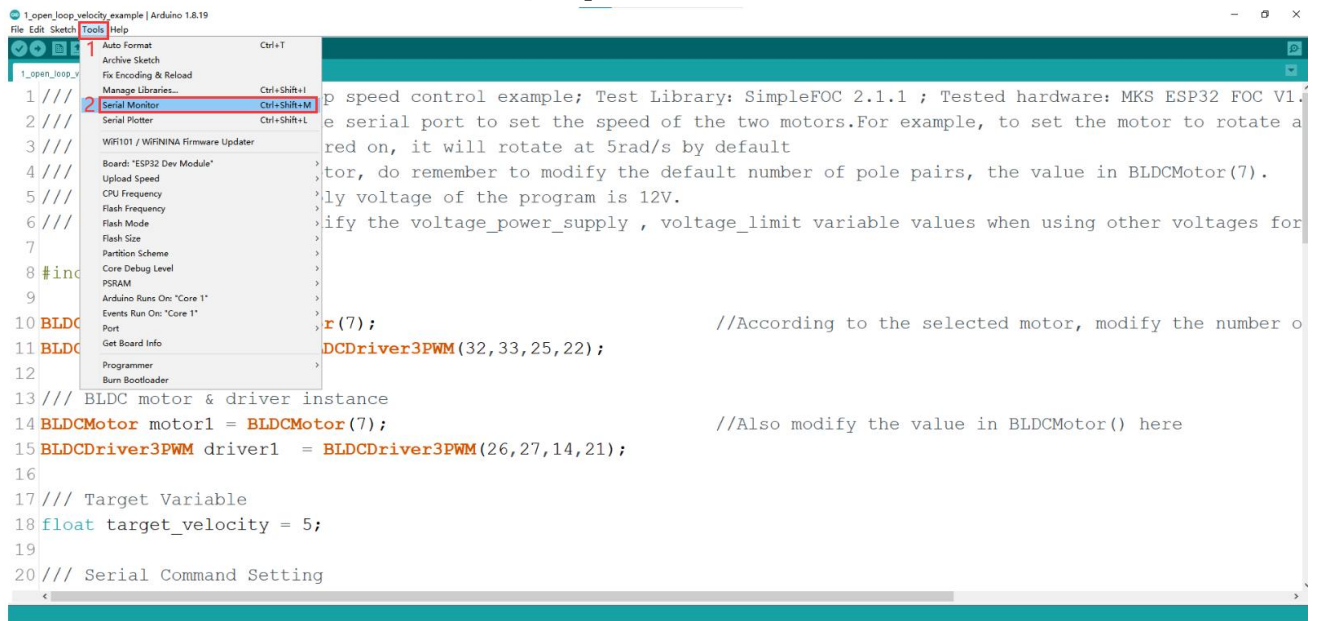

2.5 Routine test

1. After modifying the program, click the upload button in the upper left corner

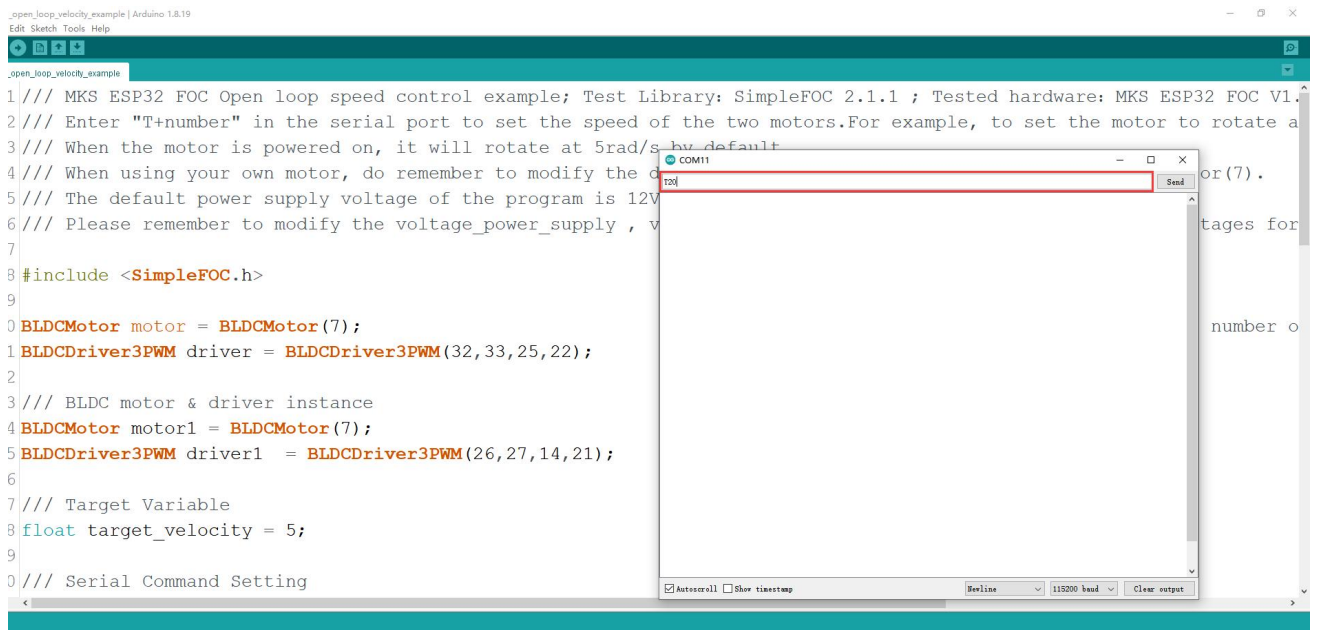

2. After the compilation is successful, the motor will rotate at a speed of 5rad/s by default.

3. Click tool=>Serial monitor, open the serial window

4. Enter the box command in the serial port window and click send to control

Enter the "T+Number" command to control the speed of the two motors.

For example, input T10, the motor will rotate at a speed of 10rad/s.

For example, input T20, the motor will rotate at a speed of 20rad/s.

For example, input T40, the motor will rotate at a speed of 40rad/s.

3.Common problems and solutions

3.1 An error occurs at I2Ctwo.begin

Solution: add UL after 400000.

3.2 When using routine 3 IIC dual encoder test (AS5600), the value printed by the serial port will not be updated

Solution: Add sensor0.update() and sensor1.update() to the loop, this is where the new version of the SimpleFOC library needs to be modified.

3.3 When printing data through the serial port, the printed ones are question marks or other special symbols

When printing data through the serial port, the printed ones are question marks or other special symbols.

3.4 Wiring problem with hall encoder

Solution: Check the relevant wiring notes in the Hall encoder test (5-wire) code and wire according to the notes.

3.5 After the power-on program runs, the serial port keeps reporting errors and restarts

Solution: Check whether the installed simplefoc library is version 2.2.2, and if so, change it to version 2.2.1.

3.6 Program burning error

Solution: Check whether the com port is selected correctly, and check whether the cable used to connect the computer and esp32 is a data cable.

3.7 When using the dual motor control routine, the serial port input command motor control does not respond.

Solution: check whether there is a newline character added when the serial port debugging assistant enters the command and whether the baud rate setting is correct.

3.8 Hall encoder wiring problem when using Hall motor

Solution: Check the relevant wiring notes in the Hall encoder test (5-wire) code and wire according to the notes.

3.9 After the power-on program runs, the motor does not rotate and the serial port displays MOT: Failed to notice movement

Solution: Check whether the motor wiring is connected stably, whether there is an open circuit, and then check whether the motor encoder wire is connected incorrectly.
